General Information

This chapter provides an overview of the Windows Admin Center (WAC), describes the functionality of the Marvell QLogic FC QConvergeConsole, and lists the components you need to run the extension locally or remotely.

NOTE

The Marvell QLogic FC QConvergeConsole provides functionality similar to Marvell's QConvergeConsole GUI, which is no longer supported.

Windows Admin Center

If you are unfamiliar with WAC, the following sections provide a general overview of this product.

NOTE

For more information about the Windows Admin Center, see the information in [“Related Materials” on page viii](#).

If you are familiar with WAC, continue to [“Marvell QLogic Fibre Channel QConvergeConsole Extension for Windows Admin Center” on page 3](#).

Introduction

Windows Admin Center is a locally-deployed, browser-based (GUI) app for managing Windows Server®(s). It is marketed as a *single-pane-of-glass* for managing multiple Windows systems. After adding WAC to a Windows system, you can interact with the Windows registry, view devices and processes, execute PowerShell® commands, and so on, all from a web browser.

WAC manages the Windows operating system through the *WAC gateway* installed on the Windows Server. The gateway manages servers by using remote PowerShell and Windows Management Instrumentation (WMI) over Windows Remote Management (WinRM). The gateway is included with Windows Admin Center in an .msi package that you can download.

How it Works

When you first open the WAC GUI, all the available connections are listed, as shown in [Figure 1-1](#).

Figure 1-1. WAC Home Page

After you select a connection, WAC displays information about the system (right side) as well as the available tools (left side), as shown in [Figure 1-2](#).

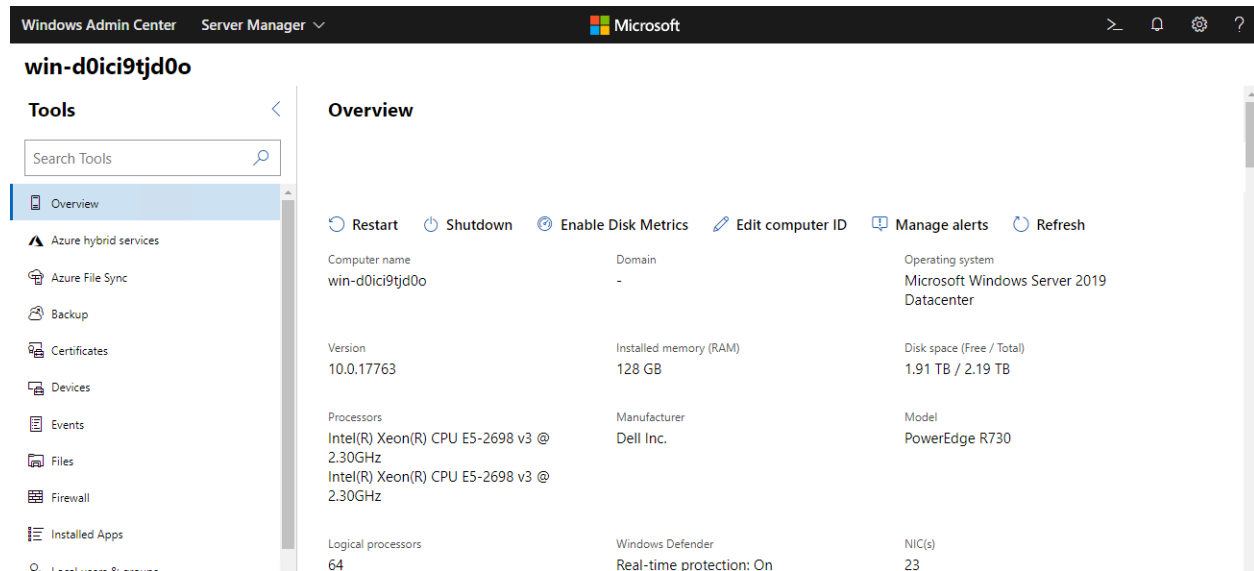

Figure 1-2. WAC When Connected to the Local System

Windows Admin Center Extensions

WAC has been built to be extensible. There are two types of extensions: tool and solution, as shown in [Figure 1-2](#).

Tools

The **Tools** pane, located on the left side of the page, contains a list of available options. After you select a tool, the tool is loaded and displayed on the right side of the page.

Extensions

To access the extensions, select **Server Manager** in the top-left of the page. By default, there are four available solution extensions:

- Server Manager
- Computer Management
- Failover Cluster Manager
- Hyper-Converged Cluster Manager

By clicking a different solution extension, the entire list of tools changes. Solutions typically define a unique type of object to be managed through WAC, such as servers, PCs, or failover clusters. In addition, solutions can be developed for connecting to and managing other devices such as network switches, Linux[®] servers, and so on. The Marvell QLogic FC QConvergeConsole is one such solution.

Marvell QLogic Fibre Channel QConvergeConsole Extension for Windows Admin Center

Microsoft allows the development of WAC extensions. The Marvell QLogic FC QConvergeConsole allows you to access Marvell's Marvell QLogic FC adapters through the WAC GUI interface.

Marvell QLogic FC QConvergeConsole can be installed on either a local or remote system, as described in the following sections.

Local System Configuration

When the local (physical) Windows Server contains the Marvell QLogic FC adapters, Marvell QLogic FC QConvergeConsole and required components are installed on this server, and FC PowerKit cmdlets get and set the Marvell QLogic FC adapter configuration locally through a GUI interface.

Figure 1-3 shows the necessary components and configuration for a local system installation. Components in the blue boxes comprise the Marvell QLogic FC QConvergeConsole.

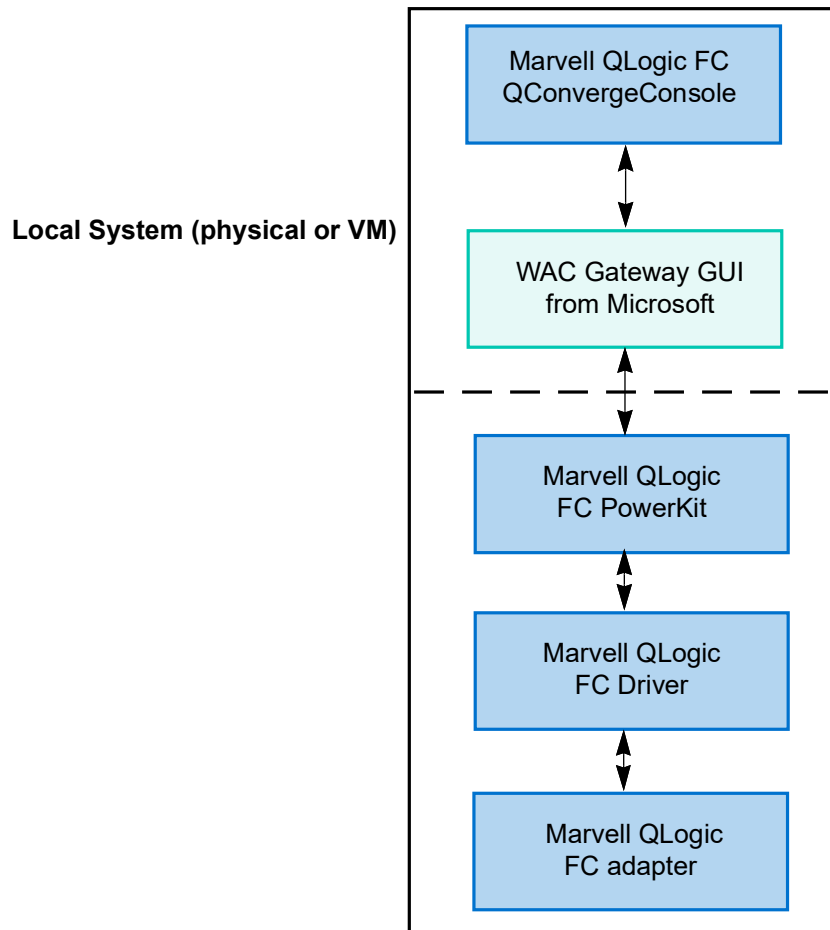

Figure 1-3. Local Configuration of Marvell QLogic FC QConvergeConsole

Remote System Configuration

In a remote system WAC configuration, one local, physical Windows Server or virtual machine (VM) is connected to one or more physical servers.

In a remote connection, the components are installed as follows:

- Local Windows system (physical or VM)
 - ☐ Marvell QLogic FC QConvergeConsole
 - ☐ WAC Gateway GUI from Microsoft

- Remote Windows system (physical server with Marvell QLogic FC adapters installed)
 - ❑ WAC Gateway GUI from Microsoft
 - ❑ Marvell QLogic FC PowerKit
 - ❑ Marvell QLogic FC Driver
 - ❑ Marvell QLogic FC Adapter

The application and required components are connected to each other using an IP address through WAC server connectivity.

A remote system configuration (WAC-to-WAC) is illustrated in [Figure 1-4](#).

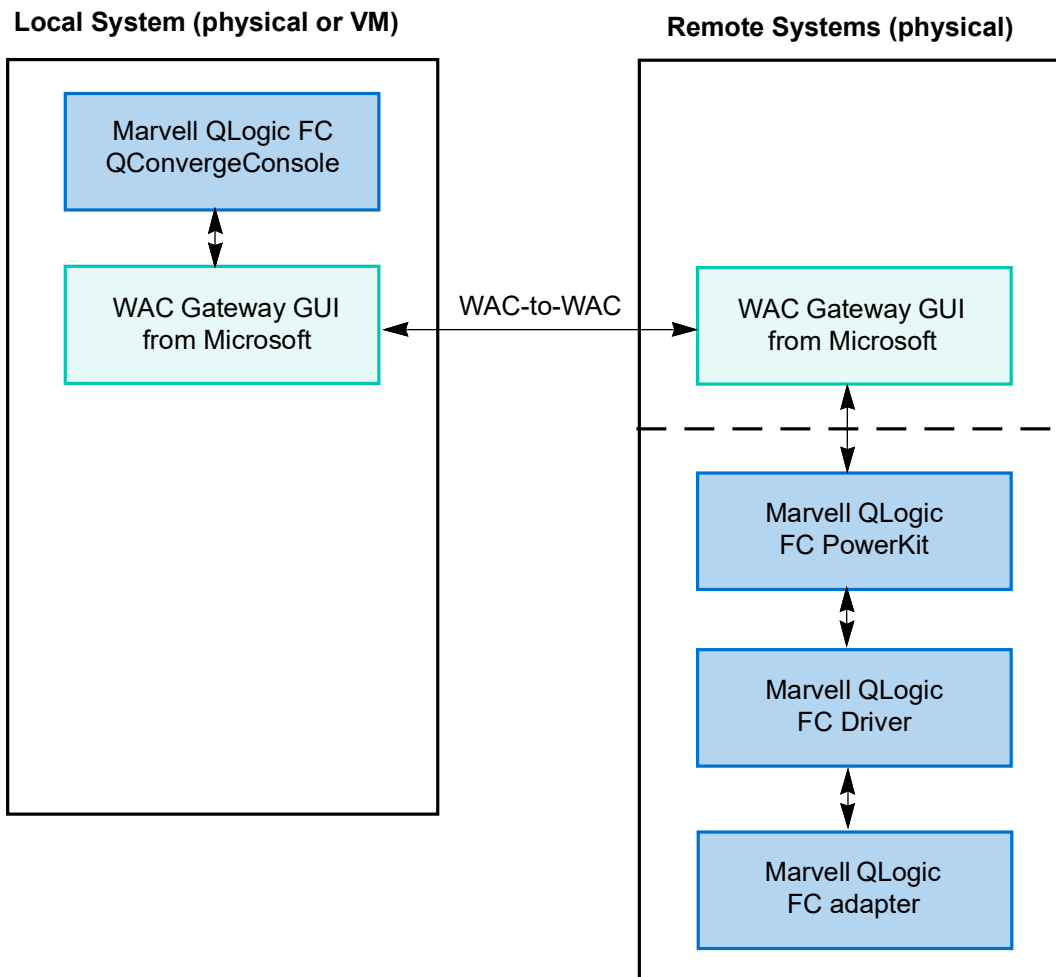

Figure 1-4. Remote Configuration of Marvell QLogic FC QConvergeConsole

System Requirements

This section lists the components you need to use the Marvell QLogic FC QConvergeConsole with Marvell QLogic FC adapters.

3 Getting Started

This chapter describes how to use Marvell QLogic FC QConvergeConsole in Windows Admin Center to configure and monitor your Marvell QLogic FC adapters.

The GUI for Marvell QLogic FC QConvergeConsole displays the available options (what you can do) on the right side of the screen. These options change depending on whether the host, adapter, port, or LUN is selected from the system tree on the left side. Selecting an option often shows other available options.

Opening Marvell QLogic FC QConvergeConsole

To open Marvell QLogic FC QConvergeConsole:

1. Launch WAC.
2. In the **All connections** section, select the desired system.
3. Under **Tools**, scroll down to the **Extensions** section, and then click **Marvell QLogic FC QConvergeConsole**.

WAC loads all the devices, and then Marvell QLogic FC QConvergeConsole launches. The GUI displays a system tree (host and attached Marvell QLogic FC adapters) on the left. On the right, the current selection is displayed with the device name at the top (host, adapter, port, target, LUN) and information about the selection. A list of available actions is underneath the hardware name.

3-Getting Started

Opening Marvell QLogic FC QConvergeConsole

In [Figure 3-1](#), the first Marvell QLogic FC adapter in the system tree is selected, and information about the adapter appears to the right. In the available actions line, the current selection is underlined; in this case, Info.

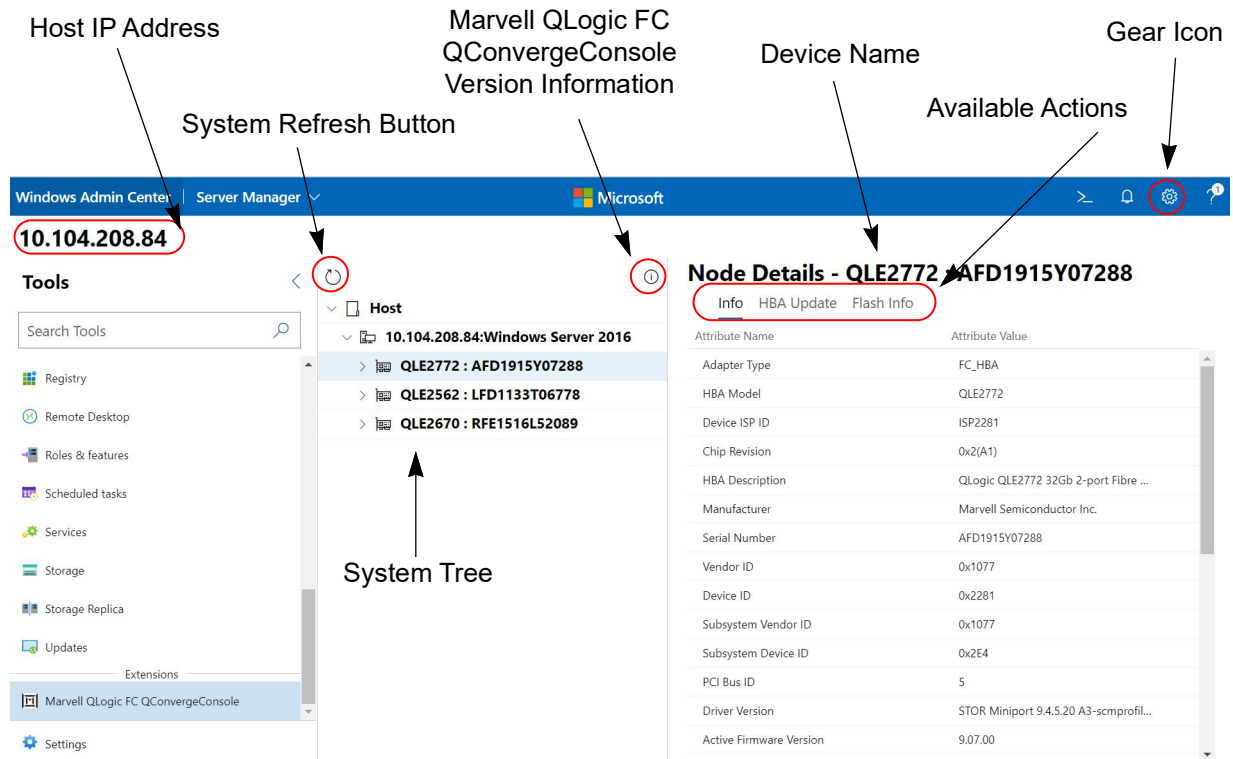

Figure 3-1. Marvell QLogic FC QConvergeConsole—Adapter Information

To view multiple hosts:

1. If needed, expand the **Tools** pane, and then scroll down to the **Extension** section to view Marvell QLogic FC QConvergeConsole.
2. Move the cursor over the extension; an option appears to open another WAC window (Figure 3-2).

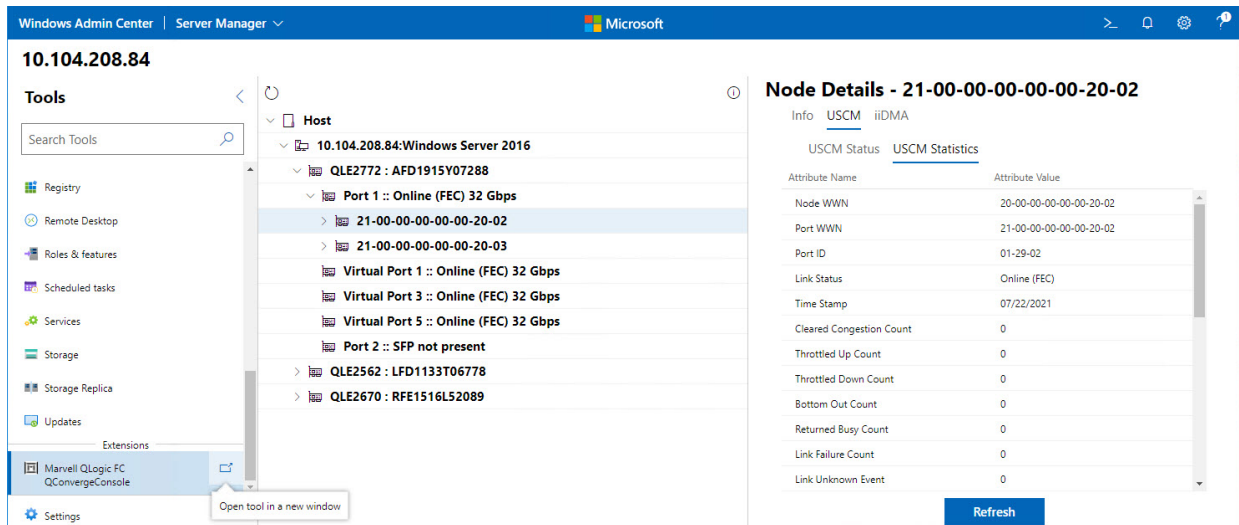

Figure 3-2. Marvell QLogic FC QConvergeConsole—Open a New Window

WAC only allows one system per window; it is a limitation of the software.

A Universal SAN Congestion Mitigation

This appendix describes Marvell's Universal SAN Congestion Mitigation (USCM) feature and how to access it with Marvell QLogic FC QConvergeConsole.

NOTE

SAN congestion management (SCM) is a common noun, and describes a standards-based Fibre Channel technology.

Universal SAN Congestion Mitigation (USCM) is Marvell's IP, and describes Marvell's capabilities that encompass SCM and additional functionalities to further assist users.

USCM is not supported on all adapters.

Overview

USCM statistics are gathered for all ports on the Marvell QLogic FC adapter and connected targets in the configured zones with active sessions.

- USCM statistics are not gathered for other initiators in the configured zones.
- USCM is supported on QLE2870, QLE2770, and QLE2690 Series Adapters.
- USCM statistics track the following types of Fabric Performance Impact Notification (FPIN) Extended Link Services (ELs) to provide SAN congestion awareness:

FPIN ELS Statistic	Initiator Port	Target Port
Congestion	✓	—
Peer congestion	—	✓
Link integrity	✓	✓
Delivery	✓	✓

- USCM also displays a set of congestion mitigation statistics that reflect actions taken by the adapter to minimize the impact of congestion caused by the endpoints.

You can view the USCM congestion mitigation status and statistics; the statistics can also be reset.

The USCM port status and statistics are described in the following sections.

USCM Initiator Port Status

The USCM initiator port congestion status ([Table A-1](#)) indicates the current status of the particular adapter port, based on congestion events (both ELS and signals) from the switch. At a given point in time, the adapter port is either *Congested* or *Healthy*. The other status indicates the congestion severity and the time since the last congestion event.

Contact the fabric/switch vendor for more information relating to congestion severity within their products.

Table A-1. USCM Initiator Port Status

Status	Description
Congestion Current State	Healthy Congested
Congestion Severity	Warning. Congestion is building and may have reached a severe level. Alarm. Congestion has reached a severe level. None. No congestion present. Reserved NOTE: For more FPIN information, see the user's guide for your switch.
Seconds Since Last Event	Event time period (in seconds) since the last congestion notification was received.
Fabric Connection Flags	RDF Reject. The adapter is either not connected or does not support RDF, or the connected switch does not support USCM. RDF Completed. The connected Brocade or Cisco switch does not support virtual lanes or the virtual lanes feature is disabled at initiator port. RDF Completed (Cisco). The connected Cisco switch has virtual lanes up and running. NOTE: RDF stands for Registration Diagnostic Function.

Virtual lanes are disabled at either the driver or the initiator port parameter (NVRAM). Virtual Lane is supported on 2770 and 2870 Series Marvell QLogic adapters.
I/O Throttling	Active. I/O throttling is currently active. The I/O queue depth is ramping up or down. None. I/O throttling is not active. I/Os are running with the normal queue depth value. Disabled. For more about virtual lanes and I/O throttling features, see the appropriate Marvell QLogic Fibre Channel Adapter User Guide

USCM Initiator Port Statistics

USCM statistics are gathered for all initiator ports of this adapter.

USCM statistics are not gathered for other initiators in the configured zones.

USCM statistics for initiators provide SAN congestion awareness by tracking three types of FPIs: congestion, link integrity, and delivery.

USCM also displays a set of statistics to track the actions taken by the adapter to minimize the impact of congestion in the fabric at the initiator ports.

The initiator congestion mitigation port statistics in [Table A-2](#) are part of Marvell's USCM functionality that reflects actions taken by the Marvell QLogic FC adapter to mitigate the congestion, while providing visibility into the initiator port's performance as a result of SAN congestion.

B USCM Virtual Lanes

This appendix provides information for USCM virtual lanes feature to Marvell QLogic adapters using WAC Extension.

Prerequisites

When setting up virtual lanes, consider the following:

- This feature is available only when the adapter is connected to a supported Cisco switch running a fabric OS version that supports the equivalent feature on the fabric.
- USCM must be enabled to use the virtual lanes feature.
- By default, the USCM virtual lanes feature is disabled.
- USCM virtual lanes feature can be enabled on both target and initiator ports.
- The USCM virtual lanes feature is available only on Fibre Channel 2770 and 2800 Series Adapters.
- USCM virtual lanes feature can be enabled/disabled using “USCM support” and “Virtual Lane” port parameters respectively as shown in [Figure B-1](#):
